Contents

<i>Contributors</i>	<i>vii</i>
1. Thymoproteasome optimizes positive selection of CD8⁺ T cells without contribution of negative selection	1
Izumi Ohigashi and Yousuke Takahama	
1. Introduction	2
2. Overview of proteasomes	3
3. Thymoproteasome for CD8 T cell generation	5
4. Concluding remarks	19
Acknowledgments	19
References	19
2. Modeling a complex disease: Multiple sclerosis—Update 2020	25
Tommy Regen and Ari Waisman	
1. Gray matter demyelination in multiple sclerosis	25
2. The influence of the microbiome on CNS autoimmunity	27
3. Identifying the pathogenic factor driving MS and EAE	29
4. Perspective and conclusion	31
References	31
3. The transcription factors GFI1 and GFI1B as modulators of the innate and acquired immune response	35
Jennifer Fraszczak and Tarik Möröy	
1. The SNAG domain transcription factors GFI1 and GFI1B	37
2. GFI1 and GFI1B in thymic pre-T cell differentiation	53
3. GFI1 in the activation and polarization of mature T cells and innate lymphoid cells	60
4. B cell commitment, differentiation and activation	69
5. GFI1 in innate immunity and the inflammatory response	72
6. Conclusion and summary	80
Acknowledgments	82
References	82

4. Panorama of stepwise involvement of the IgH 3' regulatory region in murine B cells	95
Charlotte Bruzeau, Jeanne Moreau, Sandrine Le Noir, and Eric Pinaud	
1. Structure of the IgH 3' boundary and associated regulatory region	96
2. Is the 3'RR involved in early B cell development?	98
3. Involvement of the 3'RR in Ig μ heavy chain production and B cell receptor expression	99
4. Individual 3'IgH enhancers control CSR by providing accessibility of acceptor switch regions	101
5. Involvement of the quasi-palindromic structure in somatic hypermutation	104
6. Plasma cell Ig heavy chain production depends on the full palindromic IgH 3'RR	106
7. Concluding remarks: Panorama of IgH 3'RR stepwise activation	107
8. Remaining 3'RR dark zones and future perspectives	109
Acknowledgments	110
Conflict of interest	110
References	110
